

A simple solution for software

Software doesn't have to be expensive to be commercially helpful, plus you don't need a line up of CNC woodworking machines to run value-for-money software that supports your business.

That was the message from **Gerri Hanna** of **Simple Software Solutions** to visitors to **AWISA**. "Many companies are quick to attempt to solve production problems by purchasing expensive machinery, but too often they neglect spending modest amounts on ways to resolve bottlenecks in administration."

Simple Software Solutions offers a range of software to ease the burden and taking the guesswork out

of business administration. "More detailed and accurate information can assist managers in making better decisions and improvements in performance and profitability," said Ms Hanna.

"Our software is inexpensive, tailored to this industry and flexible enough to adapt to different work practices. People with only very basic computer skills find it simple to use," she said.

Designed to be easy to use, yet fast, accurate and flexible enough to cover a wide range of work practices, the three software packages available from Simple Software Solutions can run separately or be integrated to share information and minimise data entry.

QuikQuote for quoting and price listing, produces

accurate client-ready quotes with minimal data entry. **SuperSchedule** provides complete scheduling and progress tracking for all production orders through each stage of the manufacturing process.

PowerPurchase creates orders to suppliers, linking each item to its factory job number and tracking the status and value of all orders placed.

Brendan Hanna said experience has demonstrated that time spent putting systems into practice was rewarded many times over by releasing managers to concentrate on the business. "It enables other staff to manage administration tasks and at the end-of-the-day, you control your business better instead of letting your business control you." -S-

Simple Software Solutions' Gerri Hanna and Brendan Hanna: Inexpensive software tailored to industry and flexible enough to adapt to different work practices.
